✓ Fractals are main drawings in fractal screensaver. All of them are calculated using L-system on the newest plane of Self-Similarity ( Thereby the fractals are ...Q: Citing entries in the Alcor registry I live in California. Is it legal for me to preserve my own brain for science? To put the question bluntly, if I preserved my brain, would it be a breach of a patient's human rights if I tried to publish that preservation? What laws cover this? A: California state law specifically allows you to store your brain for 70 years (link). It doesn't say anything about publishing the brain's preservation. The federal Human Subject Regulation is federal law. It's quite broad, but it allows you to use a human to further research if it meets certain specific requirements (link). However, the brain is not a human subject. There are specific rules about exactly what kind of brain can be used for research, but none of those restrict the use of your own brain (link). It is your choice as to whether you want to use a broker who will either sell or donate the brain. The state law doesn't make that decision. Q: Space complexity of a linked list What is the space complexity of a linked list and how can we calculate it? A: The space complexity is  $O(1)$ , i.e., we need to store the head and tail pointers. The space complexity for insert is  $O(1)$ , for delete is  $O(1)$ . If the linked list is not always stored, then its space complexity is  $O(n)$  since we will store two pointers. Q: Flask inheritance for user database In general I would like to have a common base class for Flask models. The problem comes from the database which is different in some cases. For example it could be an sqlite3 or pymysql. I do have a constructor which has been implemented to take into account all kinds of databases the user has. What I currently have is a class derived from SQLAlchemy models for a base class: class BaseCommon: \_\_tablename\_\_ = 'common' primary\_key = 'name' \_\_table\_args\_\_ = () def \_\_init
